Introduction

Some candidates use SQA Digital Question Papers (DQP) because they can employ text-to-speech (TTS) software to read the questions and thereby address difficulties with reading the paper due to for example dyslexia or visual impairment. It is therefore important to ensure that the technology can read the text accurately, and that candidates can understand it.

This will be even more important for assessment of the new National Literacy Units because use of a human reader will not be regarded as a reasonable adjustment where reading is being explicitly assessed, whereas use of a computer reader will.

The number of candidates or examinations where TTS is used is not recorded directly by SQA, but feedback from schools suggests that between 40% and 56% of presenting centres that request Digital Question Papers use TTS¹.

In 2012, SQA conducted a survey of centres that used Digital Question papers, and 51 (29%) out of 173 centres responded. TTS was used in 35 (51%) of the 51 centres that responded, and by 4.3 candidates per centre, on average. If this is representative of all the centres that used DQP, then TTS will have been used in 88 centres by 379 candidates, or 28.5% of the total number of candidates that used DQP.

Research and feedback from schools since digital papers were first piloted in 2006 has identified three concerns with text-to-speech software for accessing SQA Digital Question Papers.

1. The quality and intelligibility of the computer voice.
2. Accuracy of pronunciation: some words and terms are not pronounced correctly.
3. On occasion text cannot be read out by TTS because the text on the paper is an image, not selectable, readable text.

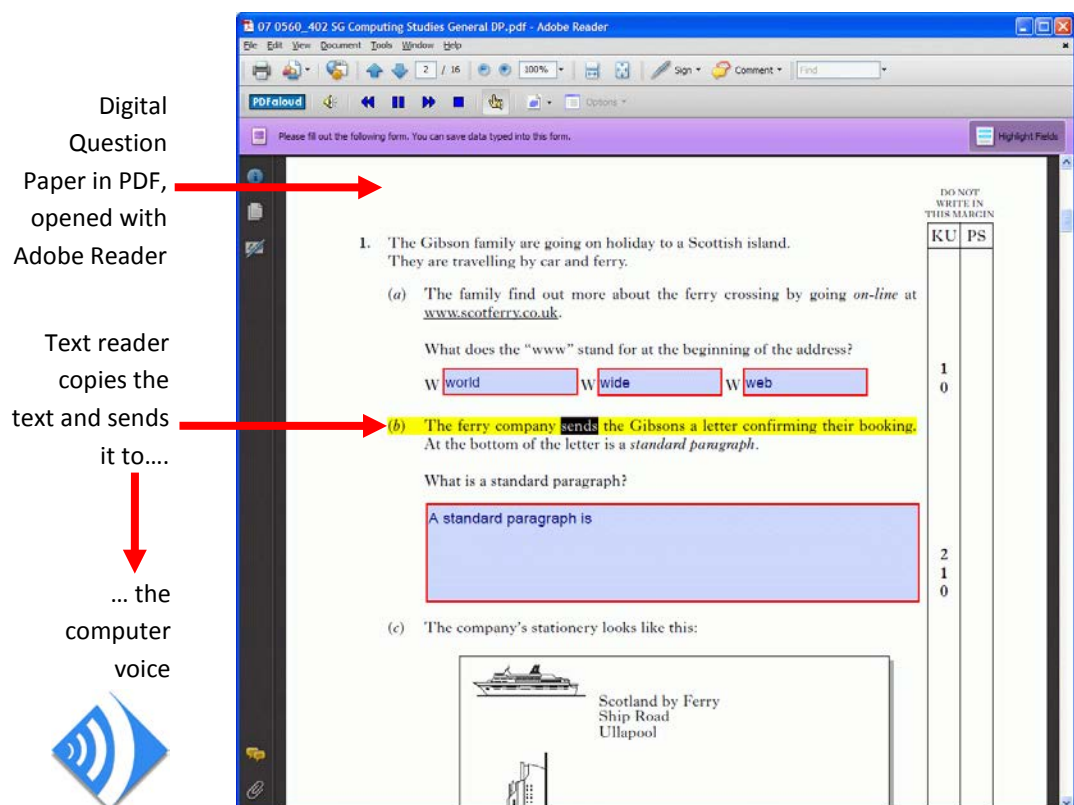

Improvements have been made across all three of these areas since the DQP were introduced. This paper summarises the progress made and presents the results of analysis of the use of text-to-speech software for the 2012 papers.

¹ Nisbet, P.D. (2013) SQA Digital Question Papers 2012 Report.

Text-to-speech software

The TTS system for accessing a DQP is composed of four separate software components:

- the digital question paper (in this case, a PDF file);
- the application used to open the file (usually, Adobe Reader);
- the text or screen reader (the application that enables the user to select the text to be read);
- the computer voice(s), such as Cereproc [Heather or Stuart](#).

The computer voice is technically independent of the text reader, although many text readers are sold bundled with high quality voices. The most common text readers used for DQPs are:

- [PDFaloud 3/Read and Write](#). PDFaloud is a simple and effective text reader but from November 2011 it has only been available as a component of Read and Write Gold, which is relatively expensive. In addition, the original version of PDFaloud does not work with the latest versions of Adobe Reader, and so it is becoming less popular.
- [Read Out Loud](#). This is built-in to Adobe Reader for Windows and provides basic TTS.
- [Ivona MiniReader](#). This is a simple, free text reader that works well for reading DQPs.

Voice quality

When DQP were first trialled in 2004, some students and staff felt TTS was useful but “many of the students commented that the synthetic voice was of poor quality and was difficult to understand” (Nisbet et al, 2004 p.4). At that time, the voices available in schools were relatively ‘robotic’ with American accents. High quality voices were available for purchase, but only with American or ‘received-pronunciation’ British English accents.

In 2008, CALL Scotland obtained funding from the Scottish Government to licence ‘Heather’, a high quality computer voice with a Scottish accent, from Cereproc, for use across Scottish schools. This was followed with further funding to develop a male voice and ‘Stuart’ was made available in September 2011. Both voices can be downloaded free of charge from CALL Scotland’s web site at <http://www.thescottishvoice.org.uk/Home/>.

Anecdotal feedback and comments from students and staff suggest that the Scottish voices improve the intelligibility and acceptance of TTS for DQP. Every year, following the examination diet, SQA staff survey staff in schools that used the DQP, and the absence of negative comments regarding voice quality and intelligibility suggests that both are satisfactory. However, an absence of negative feedback does not necessarily mean that the technology meets the needs for all students in all subjects: for example, some students may choose not to use TTS in the exam, and instead opt for a human reader, and staff are unlikely to feed back in these situations. Therefore more detailed research is required to investigate the effectiveness of TTS in assessments.

Accuracy and pronunciation

In addition to the surveys, each year CALL and SQA run a Focus Group meeting with centres that have used digital papers, and a reasonably common criticism from staff is with regard to mispronunciation by the Scottish voices. For example:

Text to speech doesn't read every word accurately, 1928 would be read as one thousand nine hundred and twenty-eight. Words are mispronounced, in particular names and places, which can affect the smooth reading of longer passages. Words containing an apostrophe are not read correctly. (Nisbet, 2010, p. 16)

Two options for improving the pronunciation of the computer voices were identified:

1. If the **text reader** has a 'pronunciation dictionary', then mis-pronunciations and corrected pronunciations can be added to the dictionary. The advantage here is that school staff and users can correct the pronunciation quickly. The disadvantage with this approach is that different text readers have different dictionaries, and some readers do not have a pronunciation dictionary at all.
2. Improve the pronunciation of the **computer voice** itself. The advantage of this approach is that the pronunciation will be improved for all text readers that use the voice.

Survey of 2011 papers

CALL carried out a survey of SQA 2011 Standard Grade General and Higher papers to identify words and terms that were not pronounced accurately by the Heather and Stuart voices. It was not practical to listen to every word of every paper (there were 69 papers, 927 pages and 108,664 words) and so the author used his experience and knowledge of TTS to skim read the papers and only test words which were likely to be mispronounced. A total of 259 words or terms were identified as mis-pronounced. The list was passed to the developers of the Scottish Voices at [CereProc](#) who created new versions of the Scottish voices, with corrected pronunciation. Most of the mispronunciations could be resolved, but some could not. For example:

- The thirty mathematical or Greek characters in the list (such as πr^2 , $a^2+b^2=c^2$, Δ etc) could not be spoken out as 'pi', 'squared' or 'delta' unless a different character encoding in the paper was employed.
- Some terms are ambiguous and so could not be normalised (e.g. is m/s metres per second or miles per second; St. Vincent St.; Ω could be 'ohm' or 'omega'; etc).

Appendix 1 lists the papers checked and words identified.

CereProc software engineers were able to make use of context to determine the correct pronunciation of some words and terms: for example, the two versions of the word 'read' in

'I read a book last week and today will read another' are correctly pronounced; while '2 kg' is spoken as '2 kilograms' whereas 'kg' is spoken as 'kay gee'.

Survey of 2012 papers

The same exercise was then carried out for the 2012 Standard Grade General and Higher papers. This time, only 49 mispronunciations were found (from 85 papers, 1,117 pages with 126,541 words). In addition, the names of all the elements in the periodic table were also checked and another 13 mispronounced words were found. Appendix 2 lists the papers checked and words identified.

Table 1 compares the number of mispronunciations in 2011 and 2012. We have removed the Greek, mathematical or scientific terms from the comparison in order to focus only on words, which gives a more accurate comparison, and therefore we note 229 mispronounced words in 2011. The comparison suggests that the accuracy of the text-to-speech for reading the 2012 papers has improved as a result of the improvements in the voice.

The accuracy of this test method cannot be guaranteed, because the author skim-read each paper and used experience to identify and then test words which were likely to be mispronounced, and so some errors may not have been identified. However, the tests do suggest that the process is reasonably effective for first identifying and then correcting errors.

Table 1: 2011 and 2012 mispronunciations

	Number of mispronunciations	Number of papers	Number of pages	Number of words	Average errors/paper
2011 papers	229	69	927	108,664	0.3
2012 papers	49	85	1117	126,541	0.6

Unreadable text elements

The third criticism of text-to-speech software for reading digital question papers was that some text elements were not readable using the software. For example, map labels in Geography papers, drawings of invoices, menus or spreadsheet extracts might look like text, but are images rather than selectable text, which cannot be read out by the computer. The analysis of the 2011 papers also revealed that the 2011 Standard Grade Graphic Communication papers could not be read at all with text to speech (Appendix 1: 2011 TTS test results).

The screen shots below give examples of unreadable text on a map and a table.

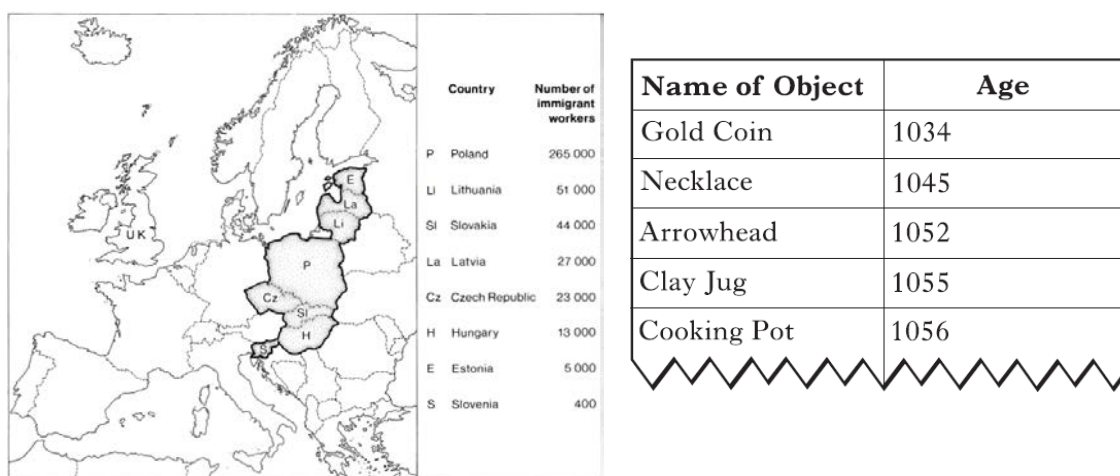

Figure 1: Unreadable text in a 2008 Intermediate 1 Geography map and a 2007 Intermediate 1 Computing Studies table

This discussion does beg questions about whether it is necessary or appropriate for a candidate to be able to use text-to-speech software to read the text items in order to answer the question: does TTS actually help candidates with reading difficulties to access these papers; and is unsupported reading and understanding a component part of the assessment, in which case does the use of TTS therefore give an unfair advantage?

Discussion with teaching and SQA staff at the annual Focus Group meetings indicated that for the majority of papers and candidates with reading difficulties:

- use of TTS to read text elements that contained information necessary to answer the question *was* desirable, and;
- use of TTS *was not* felt to give an unfair advantage.

Since papers were first offered generally in 2008, the SQA desktop publishing team has taken steps to avoid use of text elements that are not readable with TTS, through for

example using text boxes and re-creating tables and elements, rather than cutting and pasting images.

In order to determine the type and nature of any text elements that cannot be read with TTS at the current time, the 2012 Standard Grade General, Intermediate 1 and 2 and Higher papers were reviewed and the results are given in Appendix 2: 2012 TTS test results. Most of the text elements in most of the 2012 papers were readable and the incidence of unreadable items appears to be lower than for example in 2008 (although a similar exercise would have to be carried out on the 2008 papers to confirm this). Note also that the 2012 Graphic Communication paper could be read using TTS, whereas the papers for previous years could not.

The unreadable text elements that were found in the 2012 papers are given below. The main concerns are with images of handwritten memos and letters in the Administration and Information Systems papers that have to be typed up, some of which could present a barrier to candidates with reading difficulties.

TASK 3

Marks

Using the information below, prepare a letter to be sent by post to thank all of our senior fundraisers. This is the result of the search in task 2. Use the files **ALTCWP** and **ALTCLGO**.
Print one copy of the letter showing the merge fields and one copy to any one senior fundraiser for my signature.
Janet

Dear _____
Loyalty and Fundraising

We would like to take this opportunity to thank you for renewing your membership. You have been a member since * and we hope that you will continue your membership for years to come!

You are a valued fundraiser - we want to thank you for your commitment and efforts. TRS We are very pleased with the fundraising figures and would like to ask our members how they would prefer the funds to be spent.

Please use the tear off slip below to indicate your preference and return to me before the end of June.

Yours _____

The results of our consultation will be discussed at the AGM next month.

Move this sentence to become paragraph 3

The handwritten letter shown cannot be read with TTS. Candidates need to be able to read this to answer the question, and so this image could be a barrier, unless the text is already provided in the ALTCWP file that is given to the candidate.

Higher
Administration
Paper 2, p.5

3. Complete and print the Information Leaflet that will be issued to the Danish farmers when they visit Scotland next month.
The leaflet must fit on 4 pages. All text on pages 2 and 3 should be fully justified.

Page 1 - Title page with the logo and the text below.

FARMERS' MARKETS
MAKE SURE IT'S THE REAL THING

SIZE 24

The definition of a Scottish Farmers' Market is a market in which farmers, growers and producers from throughout Scotland sell their produce direct to the public. [All foods/products sold should have been grown, reared, caught, brewed, pickled, baked, smoked or made/prepared by the producer.]

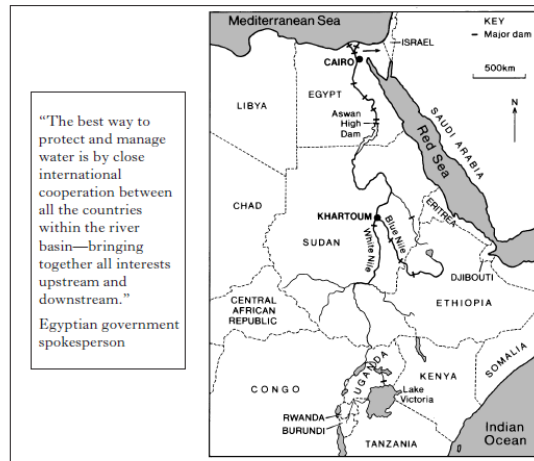

SIZE 18

The handwritten text shown cannot be read with TTS. Candidates need to be able to read this to answer the question, and so this image could be a barrier.

Intermediate 2
Geography
Paper p.10

4. (continued)

Diagram Q4B: River Nile Management Project

(b) Study Diagram Q4B.

For this or any other river management project you have studied:

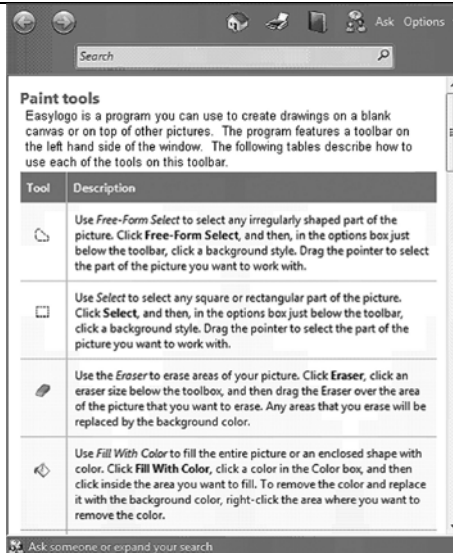

- describe the social, economic and environmental benefits;
- suggest possible disadvantages of the project.

Mark:

The map labels are not readable with TTS. However, being able to read text is not essential to answer the question and so this is unlikely to be a barrier.

6

Intermediate 2
Information
Systems p.6

The text in this image is not readable, but it is probably not required to answer the question, which is:

While creating the logo, Amy finds the following information screen useful.

State the name given to this type of information screen.

Higher
Geography
Paper 2, p.6

Question 3: River Basin Management

- (a) "The Zambezi river basin extends into 8 southern African countries. It is one of the most heavily dammed rivers in Africa."

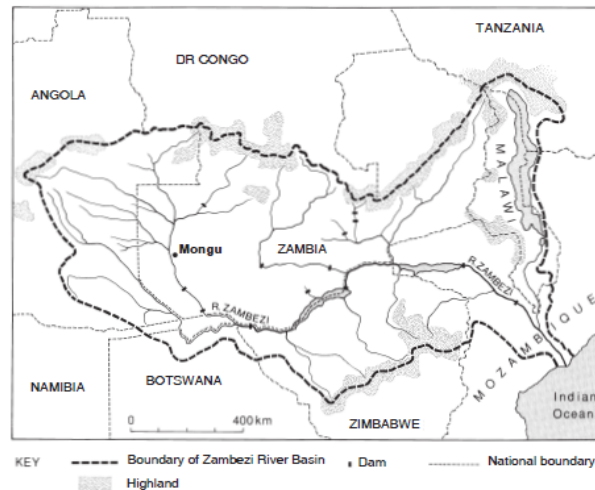

Study Map Q3 and Tables Q3A and Q3B.

Describe and **explain** why there is a need for water management within the Zambezi river basin.

- (b) **Describe** and **explain** the physical and human factors which should be considered when selecting the site for any major dam and its associated reservoir.

- (c) **Describe** and **account** for the social, economic and environmental benefits and adverse consequences of a named water control project in Africa or Asia or North America.

Map Q3: Zambezi River Basin

Marks

8 horizontal labels on this map on p.6 are readable; 5 (2 x Zambezi, Malawi, Mozambique, Indian Ocean) are not.

12

14

24

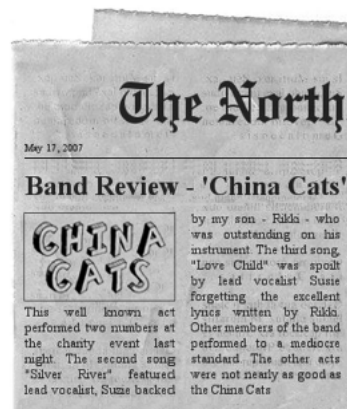

(50)

It is unlikely that this would present a barrier because the candidate is likely to be able to deduce the location of the river from the information provided.

Higher
Information
Systems p.8

SECTION II (continued)

14. *Presentation and Availability* are two characteristics that can affect the quality of information. Below is a review of an act in a local talent show which was published in the local paper, the Northbank Daily Echo. The review was written by the father of one of the band members.

The table below shows an evaluation of the review using presentation and availability.

Characteristic	Comment
Presentation	The appearance of the graphic, "China Cats", is poor and would have been improved with the use of a photograph of the band.
Availability	The availability is poor as the Northbank Daily Echo is a local paper, not available nationally.

Complete a similar table for **four** other suitable characteristics.

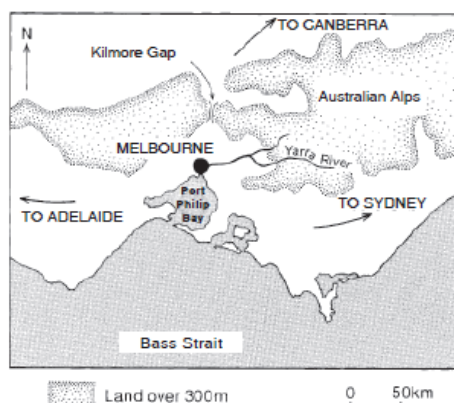

Marks

The text of the review is not readable with TTS. The candidate would need to be able to read the review in order to answer the question and so this could present a barrier.

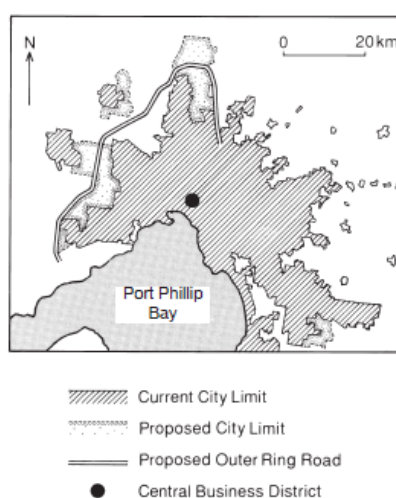

8

Question 4 – continued

Map Q4C: Site and Situation of Melbourne

Map Q4D: New Melbourne Urban Growth Boundary

Most of the labels on the maps are readable. The keys are not but this should not present a barrier for candidates for Map Q4C.

Question 4c is:
“Study Map Q4D on Page ten.
Referring to Melbourne **or** any named city you have studied in a Developed Country:

- (i) **explain** the problems caused by urban sprawl;
- (ii) **suggest ways** in which these problems may be resolved.”

Although the key does carry information about the city limits etc, the question is wide enough that it is not essential to read it and so most candidates would not be disadvantaged.

Making map labels and keys readable with TTS is relatively straightforward where the text is horizontal and involves inserting text boxes on top of the image.

Making the images of handwritten memos and letters readable is more problematic. It is possible to add ‘Alt Text’ descriptions to images, but the text can only be read by screen readers (i.e. software such as Jaws, NVDA or the built-in Read Out Loud when used to read the whole page) designed for blind or severely visually impaired users. The Alt Text cannot be read by the text readers (such as PDFaloud, MiniReader, or Read Out Loud when clicking on text or the image) used by dyslexic candidates who can see, which comprise the largest group of candidates with reading difficulties. Adding Alt Text to images does therefore not address the problem.

The only way to tackle these elements is to provide a readable text equivalent, either as separate text, or to use a suitable ‘handwriting font’ to create the elements themselves (Figure 2).

Appendix 1: 2011 TTS test results

The 2011 Standard Grade General and Higher papers were tested using PDFaloud and Ivona Minireader.

Test method:

- Look for words which were likely to be mis-pronounced, on the basis of experience.
- Test the word with PDFaloud (single word) with Stuart
- Test the word with MiniReader with Heather
- Where necessary, check pronunciation using <http://www.howjsay.com/>

The mispronounced words are arranged in tables alphabetically. Words marked 'OK' are terms which sound acceptable, but they are included here because they were previously identified by other staff. (They may have been picked up using an earlier version of Heather or Stuart.)

Appendix 2: 2012 TTS test results

Papers and documents tested for mis-pronunciations and unreadable text elements:

- 2012 Standard Grade General
- 2012 Higher
- Periodic table of elements

Test method:

- Look for words which were likely to be mis-pronounced, on the basis of experience.
- Test the word with MiniReader with Heather (version 3.0.3)
- Where necessary, check pronunciation using <http://www.howjsay.com/>

Papers tested for unreadable elements:

- 2012 Intermediate 1 and Intermediate 2.

2012 mispronunciations

Mispronounced written word	Comment	How it should sound
(i)		1
(ii)		2
(iii)		3
(iv)		4
(v)		5
¤500 (euros)	DTP problem rather than the voice	€ is spoken correctly
≤		less than or equal to
14·6 – 3·21 + 5·3	Decimal point and minus sign are not spoken	
ABC		Ae B C
AD		Ae, D.
Androclus		Andro clus
anti-aliasing		Anti ale iasing
appoggiatura		apo jer tura
arpeggio		Ar peggio
astatine		ahstatine
bolognese		bolognase
Bracadale		Brackadail
BSi		B S I
BSI		B S I
burgh		burrugh
Caesium		ceesium
Chaconne		shaconne
chorale		coral

concertino		Con certino
Cyclops	Strange intonation	Cyc lops
cytosine		cytoseen
Duchenne's		Dooshenn's
Einsteinium		einesteinium
ensemble		on somble
Fuchsia		fooshia
GUI		G U I
Hippomenes	Wrong 'o' sound	
Keswick		Kesick
Kincardine		Kincardin
Lutetium		looteeshum
medieval		Med ieval
Molybdenum		molibdenuum
Neodymium		Neo dymmium
neural		newral
neurones		new rones
neutrinos		New treen ose
omnivore	Hesitates before 'ore'	omni vore
oscilloscope		osilloscope
ostrich	Strange intonation	
patio	Breaks up the syllables	
Praseodymium		Praisio dymium
Prosciutto		Pro shutio
Qur'an		Caw rann
Rhenium		rheenum
risotto		Risawtto
Roentgenium		Rentjenium
Ruthenium		rutheenum
scherzo		scertzo
Seaborgium		Seebohr g ium
teapots	teapits	tea pots
Technetium		techneeshium
trypsinogen		trypsinojen
X	Sometimes spoken as '10', should be 'x' for an equation: suggest saying (x) as 10, otherwise x as x	
Ytterbium		itter bium

Graham Leary at CereProc reported that all of these errors could be addressed with the exception of:

- 'GUI' which is more often pronounced 'gooey' rather than 'G U I';
- 'neutrinos' and 'patios' which sound slightly strange due to technical factors that cannot be overcome.
